2008 Annual Water Quality Report

For our Purchased Water System (The portion of our township supplied with water purchased from The City of Ludington)

We are pleased to present this year's Annual Water Quality Report to our valued customers. This report, as required by the United States Environmental Protection Agency (EPA) under the Safe Drinking Water Act re-authorization, is designed to inform the consumer about where your water comes from, what it contains and how it compares to standards set forth by regulatory agencies. Our constant goal is to provide our customers with a safe and dependable drinking water supply. We continually strive to improve the water treatment process and distribution system. We appreciate the confidence our customers have placed in us and continually value your trust.

WHERE DOES YOUR WATER COME FROM?

Water is drawn via low service pumps from Lake Michigan through a submerged intake that is connected to the water treatment plant by a 36-inch diameter pipe. A 24-inch diameter crib-style intake is also used to supplement the buried intake capacity and primarily functions as a backup source. As the water enters the treatment plant it is pretreated with sodium hypochlorite (bleach) and other chemicals, such as alum to help remove impurities and destroy bad tastes and odors. Next, the water is then mixed gently in two large basins (clarifiers) so that the previously added alum can cling onto the impurities (coagulation) and cause them to form larger, heavier particles called floc. These larger particles settle to the bottom of the basin while the remaining water continues on its journey to the filters. The filters consisting of layers of sand, gravel and hard coal (anthracite) are then used to remove the remaining impurities/particles that are left in the water. After the filtration process (purification) free chlorine residual is maintained to keep the water from

developing bacteria as it travels through the many miles of piping to you. In addition, fluoride is also added to the water at the treatment plant for the prevention of tooth- decay.

DRINKING WATER QUALITY RESULTS

The City of Ludington's licensed water treatment operators routinely monitor for contaminants in your drinking water according to Federal and State laws. Results are gathered through their certified lab, as well as other independent laboratories including the State of Michigan Department of Environmental Quality (MDEQ) lab. It is important to mention that not all contaminants are tested for every year because the concentrations of these contaminants are not expected to vary significantly from year to year as determined by our State regulatory agency the (MDEQ) Drinking Water and Radiological Protection Division. Therefore, tests may be taken quarterly, annually, or every third year depending on the type of test and prior test results. **We are proud of the fact that your drinking water meets or exceeds all Federal and State requirements.** However, should there ever be an immediate health threat due to a water contaminant problem or violation we would promptly notify you by the best means possible. We perform numerous tests each day to monitor our source water, various water treatment stages and of course, the tap. The table inside this report represents the substances that were detected in Pere Marquette Township's water for the monitoring period of **January 1st to December 31st, 2008.**

It should be noted that Pere Marquette Charter Township buys a portion of its water from the City of Ludington.

HEALTH AND SAFETY INFORMATION

Drinking water, including bottled water, may be reasonably expected to contain at least small amounts of some contaminants. The presence of these contaminants does not necessarily pose a health risk. The sources of both tap and bottled drinking water include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of land or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive materials, and can also pick up substances resulting from animal or human activity.

Contaminants that may be present in source water include: **Microbial contaminants**, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife; **Inorganic contaminants**, such as salts and metals, which can be naturally occurring, or result from urban storm water runoff and residential uses; **Organic chemical contaminants**, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, septic systems, and urban or agricultural runoff (i.e., pesticides and herbicides); or **Radioactive contaminants**, which can be naturally occurring or the result of oil and gas production and mining activities.

To ensure that tap water is safe, the EPA prescribes regulations which limit the amount of certain contaminants in water provided by public water systems. The Food and Drug Administration regulations establish limits for contaminants in bottled water, which must provide the same protection for public health.

Information for Vulnerable Populations: Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should

seek advice about drinking water from their health care providers. Federal guidelines on appropriate means to lessen the risk of infection by cryptosporidium and other microbiological contaminants are also available from EPA's Safe Drinking Water Hotline, 800.426.4791.

DEFINITION KEY

Parts per million (ppm) and parts per billion (ppb) - One ppm can be equated to a single penny in \$10,000. One ppb is a single penny in \$10,000,000.

Maximum Contaminant Level Goal (MCLG) - The MCLG is the level of a contaminant in drinking water below, which there is no known or expected health risk. MCLGs provide a margin of safety.

Maximum Contaminant Level (MCL)- The MCL is the highest level of a contaminant that is allowed in drinking water. MCL's are set as close to the MCLG's as feasible, using the best available treatment technology.

MCL's are set at very stringent levels by the State and Federal government. To understand the possible health effects, a person would have to drink about two liters (quarts) of water every day at the MCL level for a lifetime to have

a one-in-a-million chance of having the associated health effect.

Maximum Residual Disinfection Level (MRDL) -The highest level of disinfectant allowed in drinking water.

Nephelometric Turbidity Unit (ntu) measures clarity.

Action Level (AL) - The concentration of a contaminant, which if exceeded, triggers treatment or other requirements, which a water system must follow.

Treatment Technique (TT) - A treatment technique is a required process intended to reduce the level of a contaminant in drinking water.

na - not applicable/available.

More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's (EPA's) Safe Drinking Water Hotline at 800.426.4791

Listed below are the contaminants/ substances that were detected in the Pere Marquette Township's Water System for the year 2008 purchased from the City of Ludington.

ALL DETECTED CONTAMINATES/SUBSTANCES ARE BELOW ALLOWED LEVELS.

Not listed are the hundreds of other contaminants tested for, but not detected in the Township's Water.

TEST RESULTS FOR 2008

Regulated Monitoring at the Treatment Plant

Substance	Units	Range Detected	Average	MCL	MCLG	Violations	Possible Sources of Contaminate
Barium	ppm	NA	0.02	2	2	No	Erosion of natural deposits.
Nitrate	ppm	NA	0.4	10	10	No	Runoff from fertilizer use.
Selenium	ppb	NA	1	50	50	No	Erosion of natural deposits.
Fluoride	ppm	0.89 -1.11	1.00	4	4	No	Water additive which promotes strong teeth.
Turbidity[1]	ntu	0.04 -0.09	0.06	5	TT= 0.5 (ntu)	No	Soil runoff, suspended matter in lake water.
Total Organic Carbon [2]	ppm	1.27-2.07	1.53	TT	NA	No	Naturally present in the environment.

Regulated Monitoring in the Distribution System

Substance	Units	Range Detected	Average	MCL	MCLG	Violations	Possible Sources of Contaminate
(HAA5) Haloacetic Acids [3]	ppb	21.0- 72.0	35.0	60	0	No	Formed when chlorine is added to water with naturally occurring organic material.
Free Chlorine Residual	ppm			4	MRDL=4	No	Used to disinfect drinking water.
(TTHM) Total Trihalomethanes [3]	ppb	35.0- 68.0	48.0	80	0	No	Formed when chlorine is added to water with naturally occurring organic material.

Regulated Monitoring at Customer's Tap (compliance is determined using the 90th percentile, where nine out of ten samples must be below the Action Level).

Substance	Units	90th Percentile	Date Sampled	Action Level (AL)	MCLG	# of Samples Above(AL)	Possible Sources of Contaminate
Lead	ppb	11.5	Jun-08	15.0	0	0	Corrosion of household plumbing system.
Copper	ppm	0.125	Jun-08	1.3	1.3	0	Corrosion of household plumbing system.

Unregulated Monitoring

Substance	Units	Range Detected	Average	MCL	MCLG	Violations	Possible Sources of Contaminate
Sodium	ppm	NA	9.0	NA	NA	No	Erosion of natural deposits.
Sulfate[4]	ppm	NA	23.0	NA	NA	No	Erosion of natural deposits.

Footnotes:

1. Turbidity is a measurement of water clarity. We monitor turbidity because it is a good indicator of our filtration process. The limits for turbidity state that all samples must be below 5 ntu and that 95% of the samples must be lower than 0.5 ntu. All samples were well below 0.5 ntu.

2. The average shown for Total Organic Carbon (TOC) is the running annual average calculated quarterly. All TOC removal requirements were achieved as determined by the State.

3. The average shown for Total Trihalomethanes (TTHM) and Haloacetic Acids (HAA5) is the running annual average calculated quarterly.

4. The MCL for Sulfate is actually a secondary MCL that is not health related, nor federally-enforced. The purpose of the secondary MCL is to help improve water aesthetics.

PUBLIC PARTICIPATION

Interested citizens are welcome to attend the Pere Marquette Township Board meetings to hear more about current projects involving the Township's water system. Meetings are held the second and fourth Tuesday of each month at 7:30 p.m. at the Pere Marquette Township Hall, 1699 South Pere Marquette Highway.

For More Information, Please Contact:

Andy Larr

Superintendent of Utilities & Public Works
231-845-7640

QUESTIONS? COMMENTS?

The Township's utility department is on call around the clock to provide quality water to residents and businesses. If you have any questions or comments, or would like to receive more specific information about Township's water system, please feel free to call Andy Larr, Superintendent of Utilities & Public Works, at 231-845-7640 from 8:00 am to 4:30 pm weekdays.
